

## SUPPLY CHAIN VISIBILITY

# DB Schenker digitalizes Europe's leading land transport network

With the Control Tower in Frankfurt, DB Schenker's land transport experts have a real-time view of the whole of Europe: 430 terminals, 2,000 daily connections, more than 40,000 partner companies. It enables DB Schenker's team to steer, optimize, monitor and maintain our linehaul network throughout Europe.

The system, called LiNeS, is one of numerous network and platform applications that have been created in recent years in cooperation between land transport experts and DB Schenker's inhouse IT. These include the carrier platform Drive4Schenker or the new Transport Management System, the deployment of which is currently being prepared throughout Europe.

This shows: The future of land transport is digital - and with the sensible use of digital technologies, it will become increasingly efficient, economical, smarter and more climate-friendly.
